

My Report

Catching missing methods

```
Dynamic >> doesNotUnderstand: m  
    ^ m selector asString , ' handled'.
```

What happened: Any message I sent that didn't exist got "handled", even when I made a typo.

What I learned: doesNotUnderstand: catches every unknown message, so it can hide mistakes if you don't filter it.

I also watched the refactoring videos that helped me have a better understanding of how you're supposed to refactor code in pharo, which will probably be helpful for the project.
